

**MG40** To access the input plate on the MG401, the user simply applies pressure on the top panel. This, in turn, releases the latch and allows the pneumatic gas-powered spring to tilt the input plate into view. Once opened, the input plate remains securely in place. To hide the MG 401 from view, the user presses on the top panel once more to automatically close and latch the lid. In its closed position, the top panel lies flush with the tabletop.
